

Dräger**Gas detection pump, Type: PUMP****Order data**

Order number	097204 PUMP
GTIN	4026056021628
Item class	09J

Description**Version:**

Each measuring tube consists of a thin glass tube melted at the ends to seal it. Inside there is a chemically reactive filling layer. To perform a measurement, break the ends off the tube and insert it into the gas detection pump. The pump compresses the air that is to be tested, which causes the filling layer to change colour when it reacts with the respective gas. The concentration can be read off on an integral scale.

Manual pump for use with Dräger direct detection tubes. Can easily be operated using only one hand. Integral tube opening, stroke counter. Operation without electricity or battery, therefore suitable for use in EX areas.

Note:

A selection of around 300 different types of tube is available on request. These allow more than 500 substances to be measured quickly and easily, in many different concentrations.

For safety technical reasons gas detection devices cannot be returned.

Technical description

Tool properties	Egnet til Ex-område
Type of product	Single gas detection device
